

## ABSTRACT OF THE INVENTION

A slideable hole punch, having an upper seat, at least a set of drills and a lower seat. The upper seat has a slide track allowing one slide member to move thereon. The upper seat is fitted over the lower seat. The lower seat  
5 accommodates the set of drills and has an internal slot. The set of drills is disposed between the upper and lower seats. A paper slot is formed between the upper and lower seats. Thereby, paper can be disposed in the paper slot and slide along the slide track by the slide member. The slide member can then press upon the set of drills to perforate through the paper to form holes  
10 with desired shapes and distances.
